

Morgan Stanley – Portfolio Allocation Insights Dashboard

Documentation by Soham S. Amburle | 18 – 20 January 2026

The Portfolio Allocation Insights Dashboard provides a structured and strategic view of how client assets are distributed across risk profiles, client tiers, and regions at Morgan Stanley. Using a synthetic financial dataset, the dashboard focuses on portfolio composition, capital allocation patterns, concentration risk, revenue quality, and capital flow momentum.

Designed in Power BI, this dashboard is intended for senior leadership, portfolio managers, risk and compliance teams, wealth management heads, and strategy stakeholders to evaluate portfolio health, assess risk-return alignment, and support data-driven portfolio and capital allocation decisions.

Through a combination of executive KPI cards, allocation charts, scatter-based momentum analysis, heatmaps, trend visuals, composition charts, and interactive slicers, the dashboard delivers actionable insights into portfolio structure, behavior, and risk exposure.

Portfolio Allocation Insights – Executive Storyline

The Portfolio Allocation Insights Dashboard presents a clear narrative of how assets under management, capital flows, revenue, and risk exposure interact across client segments and regions, while also highlighting trends and early warning signals.

The analysis begins with an executive snapshot of portfolio health using five KPI cards:

- **Total AUM (USD):** Represents the total assets under management within the selected context, providing a measure of overall portfolio scale.
- **Net Flows (USD):** Indicates net capital inflows or outflows, serving as a key signal of portfolio momentum and client behavior.
- **Total Revenue (USD):** Captures the aggregate revenue generated from the portfolio, linking asset allocation to financial performance.
- **Average AML Risk Score:** Acts as a portfolio-level risk proxy, indicating the overall risk posture of the selected portfolio segment.

- **Average AUM per Client (USD):** Measures portfolio depth and relationship quality, highlighting whether growth is driven by deeper client relationships or broader client acquisition.

Together, these KPIs establish a baseline understanding of portfolio size, growth dynamics, revenue quality, and risk exposure, allowing leadership to quickly assess overall portfolio health.

Following the executive snapshot, the dashboard introduces portfolio composition analysis through a stacked column chart, AUM Allocation by Risk Profile and Client Tier.

This visual illustrates how assets are distributed across different risk profiles and further segmented by client tier, enabling identification of:

- Concentration of assets in conservative versus aggressive risk buckets
- Client segments driving risk exposure
- Imbalances in portfolio allocation across risk appetites
- This supports strategic discussions around risk distribution and portfolio diversification.

The dashboard then shifts to portfolio behavior and momentum analysis using a scatter plot, Portfolio Momentum (Net Flows vs AUM):

- **X-axis:** Total AUM
- **Y-axis:** Net Flows
- **Bubble size:** Total Revenue
- **Color:** Client Tier
- **Detail:** Risk Profile

This visual distinguishes between portfolios that are large due to historical accumulation and those actively attracting capital. It highlights strong portfolios, at-risk portfolios with sustained outflows, and emerging growth opportunities, enabling leadership to proactively manage portfolio risk and growth strategies.

To assess concentration risk, the dashboard presents a matrix heatmap, AUM Concentration by Region and Risk Profile.

This visual highlights geographic clustering of assets across risk profiles and uses conditional formatting to emphasize areas of high exposure. It supports identification of regional dependencies, overconcentration in aggressive risk profiles, and diversification gaps across the portfolio.

A revenue quality assessment is then introduced through a clustered column chart, Revenue Contribution by Risk Profile and Region.

This visual evaluates whether higher-risk portfolios are delivering proportionate revenue returns and identifies regions where revenue generation may be misaligned with portfolio risk. It directly supports governance questions around risk-adjusted performance.

To incorporate a time-based perspective, the dashboard includes a line chart, Net Flows Trend by Risk Profile, which tracks capital movement over reporting periods. This trend analysis helps identify:

- Sustained inflows or outflows by risk profile
- Shifts in client risk appetite over time
- Early warning signals of portfolio stress or risk aversion

This temporal view enables leadership to anticipate structural changes rather than react after performance deterioration.

Finally, a portfolio composition snapshot is provided through a pie chart, AUM Distribution by Client Tier, offering an executive-friendly overview of how total assets are split across client segments. While not a deep analytical visual, it supports rapid understanding of portfolio dependency on specific client tiers during high-level discussions.

Interactive slicers allow dynamic filtering of all visuals by:

- Region
- Client Tier
- Risk Profile

These slicers enable tailored portfolio analysis while maintaining a consistent analytical narrative across the dashboard.

Visuals and Description -

1. **Cards (KPI Indicators):** Five cards provide an executive snapshot of portfolio health: :
 - **Total AUM (USD):** Overall portfolio size within the selected context.
 - **Net Flows (USD):** Net capital movement indicating portfolio momentum.
 - **Total Revenue (USD):** Aggregate revenue generated from the portfolio.
 - **Average AML Risk Score:** Portfolio-level risk exposure proxy.
 - **Average AUM per Client (USD):** Indicator of portfolio depth and relationship quality..
2. **Slicer:** Interactive slicers allow dynamic filtering of all visuals:
 - **Region:** Geographic segmentation
 - **Client Tier:** Client segmentation
 - **Risk Profile:** Risk-adjusted productivity
3. **AUM Distribution by Client Tier (Pie Chart):** Provides an executive-level composition snapshot of portfolio assets by client segment.
4. **AUM Allocation by Risk Profile and Client Tier (Stacked Column Chart):** Displays how assets are distributed across risk profiles and client tiers, highlighting concentration and diversification patterns.
5. **Portfolio Momentum – Net Flows vs AUM (Scatter Plot):** Plots portfolio size against capital flows, with bubble size representing revenue and color indicating client tier, highlighting portfolio strength, risk, and growth opportunities.
6. **Net Flows Trend by Risk Profile (Line Chart):** Shows capital flow trends over time, supporting early detection of behavioral and structural shifts in portfolio allocation.
7. **AUM Concentration by Region and Risk Profile (Matrix Heatmap):** Visualizes geographic and risk-based concentration of assets using conditional formatting to highlight high-exposure areas.
8. **Revenue Contribution by Risk Profile and Region (Clustered Column Chart):** Compares revenue generation across risk profiles and regions, assessing risk-return alignment.

The Portfolio Allocation Insights Dashboard enables Morgan Stanley stakeholders to:

- Understand portfolio composition across risk profiles and client tiers
- Identify concentration and diversification risks
- Evaluate whether portfolio risk is generating adequate revenue
- Monitor capital flow momentum and early warning signals
- Assess portfolio depth through average AUM per client
- Support risk-aware, data-driven portfolio strategy and capital allocation decisions

By combining executive KPIs, allocation analysis, momentum visuals, concentration heatmaps, trend analysis, and interactive controls, this dashboard delivers a comprehensive and executive-ready view of portfolio health and risk exposure.
